

ABSTRACT OF THE DISCLOSURE

The invention relates to a process for treating a chromate waste liquid containing an organic acid component. This process includes (a) adding a chromium precipitation  
5 accelerating agent containing at least one of a calcium component and a magnesium component, to the chromate waste liquid; and (b) adjusting the chromate waste liquid to having a first pH of 9 or higher, thereby precipitating a chromium component from the chromate waste liquid and  
10 thereby reducing a concentration of a dissolved chromium component of the chromate waste liquid.
